

Dear Colleagues,

I invite you to read the current number of the *Journal of Hearing Science* which features papers on electrical activity of the brain as shown by electroencephalography (EEG) and on cochlear implants (CIs). The two EEG studies involve a comparison of EEGs with fMRI, and of auditory evoked potentials evoked by tones and speech. The other two CI papers describe the results of rehabilitation of CMV patients, and parental satisfaction with the rehabilitation services provided to their children.

In addition to these and other research papers in the current issue, you will find reports from the American Auditory Society's (AAS) Scientific and Technology Meeting, the Symposium of the International Evoked Response Audiometry Study Group (IERASG), and the Asia Pacific Symposium on Cochlear Implants and Related Sciences (APSCI 2015). In case you couldn't attend the conferences themselves, I hope you find these reports useful and illuminating.

With kind regards and greetings,

*Prof. Henryk Skarzynski, M.D., Ph.D., Dr.h.c.multi*
